Wyoming Agricultural Statistics 1980

BEST AVAILABLE COPY

Economics, Statistics, and Cooperative Service

TO: Users of Wyoming Agricultural Statistics

It is with pleasure that we provide you with a complimentary copy of the 1980 issue of "Wyoming Agricultural Statistics". This publication contains data pertaining to Wyoming agriculture. Included are data on crop and livestock production, income, stocks, inventories, prices, farm labor, livestock movement and weather for the State. County estimates are also included if available. You will find current data and many historical tables and graphs.

Additional copies are available upon request.

P R E F A C E

This publication presents major agricultural statistics developed by the Wyoming Crop and Livestock Reporting Service. Included are data relating to livestock number and production, crop production, farm income, prices and weather information relating to agriculture. State estimates are shown for five-ten years, county estimates of livestock for January 1, 1976-80 and county estimates for crops are shown for 1978-79.

I want to give special thanks to the many Wyoming farmers, ranchers and agribusiness people who voluntarily provided the essential raw data for making these estimates possible. This information would not be possible without their devoted service. We would like to thank the Livestock Sanitary Board and the Wyoming Stockgrowers Association who provide access to the information used in developing the livestock movement data both in to and out of Wyoming.

Collection of data for making these estimates is made possible through the cooperative effort of the Wyoming Department of Agriculture and the Economics, Statistics and Cooperative Service of the U.S. Department of Agriculture. Funds are furnished by both departments which have had a cooperative agreement since 1923. Publication of this report was made possible through the cooperative effort of these two agencies along with the University of Wyoming Agricultural Experiment Station, Division of Agricultural Economics.

Estimates presented in this publication are based on data provided by agriculture producers and agribusiness establishments. Data for many of the estimates were obtained through special mail surveys. Mail surveys are widely used to provide statisticians with general purpose samples collecting information on an

array of agricultural activities.

Probability sampling techniques have been developed in recent years. Probability sampling provides information for computing sampling errors; thus, estimates can be made with a known degree of precision. The land area sampling frame was developed in which a sample of randomly selected land segments have been designated throughout the State. These segments of land have been selected so that they represent a complete sample coverage of agriculture. All agriculture within these segments are expanded to represent the State.

An additional sample source has been developed for estimating cattle in Wyoming. A list of all livestock producers in the State is compiled by size of operation. This list comprises a list frame for sampling. A sample of producers is selected from this list and the area frame sample is used to represent those operators whose names are not on the list. Therefore, the two sample sources are combined and this technique is called "Multiple Frame Sampling". The two sample sources are used together in arriving at the total number of cattle for the State. The livestock list is now being expanded to include all crop operations. This will enable us to select better acreage survey samples for making crop estimates.

Additional copies of this publication are available upon request to the Agricultural Statistician, P. O. Box 1148, Cheyenne, Wyoming 82001. Copies may also be obtained from the Commissioner, Wyoming Department of Agriculture, Cheyenne, Wyoming 82002, or the Head, Division of Agricultural Economics, University of Wyoming, Laramie, Wyoming 82071.

General

WYOMING AGRICULTURE - 1979

Wyoming's farm and ranch operators' income rose significantly during 1979 to total \$69.6 million after inventory adjustment. The total net farm income was up \$25.0 million from 1978 and far above the \$16.3 million loss recorded in 1977. The net income per operation averaged slightly under \$9700 for 1979.

Gross farm income rose nearly 24 percent as cash receipts moved up by 27 percent indicating a sharp drop in government payments to farmers and ranchers. The value of livestock and crop inventories rose \$1.5 million, or nearly 14 percent over 1978. Production expenses rose at a rate of about 21 percent to reach over \$695 million, nearly \$120 million above the 1978 total.

Cattle prices during 1979 were 30 percent above the 1978 levels. Other livestock price increases were not as dramatic but all items except hogs did post higher annual averages. Through 1979, cattle numbers rose 3 percent to 1,340,000 head on January 1, 1980. Beef cow numbers were increased 1 percent as Wyoming ranchers continued the herd rebuilding of 1978. The 1979 calf crop was 4 percent smaller than the year before.

The total liveweight of cattle and calves marketed during 1979 was 1 percent greater than 1978 as a result of increased numbers during 1977. Cash receipts were 28 percent higher primarily because of higher prices. Cattle averaged \$71.40 per hundredweight during 1979 and calves averaged \$93.50. Prices were higher during all months of the year when compared with 1978.

Sheep numbers continued their decline during 1979 to stand at 1,050,000 head on January 1, 1980. Sheep and lambs on feed for slaughter on January 1, 1980 were down 25 percent from a year earlier to 90,000 head. The 1979 lamb crop was down 4 percent to 622,000 head. Total sheep and lamb losses were down 2 percent to 237,000 head. However, predator

losses were up 9 percent while weather related deaths declined 15 percent. The total liveweight of sheep and lambs marketed dropped 1 percent but due to higher prices the cash receipts were 2 percent greater. Sheep prices averaged 15 percent higher at \$32.00 per hundredweight while lamb prices averaged only 3 percent higher at \$69.60. Wool prices improved by 21 percent to average 91¢ per pound.

Total production of field crops in Wyoming was 2 percent below the 1978 output. Spring planting started on time, but then was delayed for a period of time by wet, cold weather. As a result, many crops were planted later than normal. Soil moisture deteriorated in many areas after the end of April and supplies were short in many dryland growing areas throughout most of the growing season. Irrigation water was adequate in most areas. Farmers had an open fall to harvest crops. Many crops matured later than normal due to late plantings and the wet, cool spring. Small grain and sugar beet yields were lower than 1978 while corn, hay and dry bean yields were higher.

The total harvested acreage was down 1 percent with the largest declines in other hay and winter wheat. Cash receipts from the sale of crops amounted to \$96 million, 21 percent more than in 1978. Prices for all crops except potatoes were higher in 1979 than a year earlier. The largest gain was in dry edible bean prices while wheat, barley and hay posted significant increases.

During 1979 the average size of an agricultural operation in Wyoming was unchanged at 4,875 acres. The value of the land increased 7 percent to \$127 per acre.

SPRING FREEZE HAZARD TABLE

NOTE: Persons using this table should establish the temperature relationship between one or two of the nearest stations listed and their own locale. This is because the generally rough terrain of Wyoming produces many variations in climate from one point to the next.

PROBABILITY OF TEMPERATURE DROPPING TO 32° AND 28° AFTER DATE SHOWN

FALL FREEZE HAZARD TABLE

NOTE: Persons using this table should establish the temperature relationship between one or two of the nearest stations listed and their own locale. This is because the generally rough terrain of Wyoming produces many variations in climate from one point to the next.
